

Tree Protector Net

The mesh tubes protect young seedlings from nibbling intruders for up to five years. Allow young seedlings to grow and slowly photodegrade once seedlings have grown to a point of establishment. For best results, install tubes at time of planting and cover entire seedling. Allow 10" to 12" of tubing to extend above tree to compensate for later growth and tree top protection. Each net comes with 1 stake.

Tree Protector Tube

Designed to protect seedlings and accelerate early growth, Blue-X Tree Shelters feature two-piece construction and create a beneficial microclimate to aid in seedling survival. Each shelter is comprised of a single sheet of blue plastic film which is inserted into a blue-tinted poly sleeve. The film produces amplified blue light to increase beneficial photosynthetically active radiation and boost tree diameter growth. The shelters block a significant amount of harmful UV light which can hinder growth. Each tree shelter measures 3-1/2" in diameter, has an outdoor life of 5 years. Each tube comes with 1 stake.

Bamboo Stake

Bamboo stakes are up to three times stronger than traditional wooden stakes of comparable diameter. They are great for securing tree protectors, supporting plants or for field staking. Each bamboo stake is 3 feet long and approximately 3/8 inch in diameter. Stakes can be purchased on an individual basis but also provided when purchasing a tube or net.
